Kaggle CLI

The official CLI to interact with [Kaggle](#).

[User documentation](#)

Key Features

Some of the key features are:

- List competitions, download competition data, submit to a competition.
- List, create, update, download or delete datasets.
- List, create, update, download or delete models & model variations.
- List, update & run, download code & output or delete kernels (notebooks).
- Browse and read discussion forums.

Installation

Install the `kaggle` package with [pip](#):

```
pip install kaggle
```

Additional installation instructions can be found [here](#).

Quick start

Explore the available commands by running:

```
kaggle --help
```

See the [User documentation](#) for more examples & tutorials.

Hosting a competition

End-to-end host commands — scaffold a new competition, author its pages, and launch it — are documented in [docs/competition_creation.md](#). Covers `kaggle competitions init`, `create`, `pages create`, and `launch`.

Development

kagglesdk Updates

New features that interact with `kaggle.com` probably require changes to the Python library, `kagglesdk`. Make sure to bump the minimum version required for `kagglesdk` in the `dependencies` list specified in `[pyproject.toml][pyproject.toml]`. Make sure the required version is available on the [pypi.org kagglesdk project](https://pypi.org/project/kagglesdk/).

Prerequisites

We use [hatch](#) to manage this project.

Follow these [instructions](#) to install it.

Run kaggle from source

Option 1: Execute a one-liner of code from the command line

```
hatch run kaggle datasets list
```

Option 2: Run many commands in a shell

```
hatch shell
```

```
# Inside the shell, you can run many commands
kaggle datasets list
kaggle competitions list
...
```

Lint / Format

```
# Lint check
hatch run lint:style
hatch run lint:typing
hatch run lint:all      # for both
```

```
# Format
hatch run lint:fmt
```

Tests

Note: These tests are not true unit tests and are calling the Kaggle web server.

```
# Run against kaggle.com
hatch run test:prod

# Run against a local web server (Kaggle engineers only)
hatch run test:local
```

Integration Tests

To run integration tests on your local machine, you need to set up your Kaggle credentials. You can do this by following the [authentication instructions](#).

After setting up your credentials, you can run the integration tests as follows:

```
hatch run test:integration
```

Running hatch commands inside Docker

This is useful to run in a consistent environment and easily switch between Python versions.

The following shows how to run `hatch run lint:all` but this also works for any other hatch commands:

```
# Use default Python version
./docker-hatch run lint:all
```

Changelog

See [CHANGELOG](#).

Contributing

See [CONTRIBUTING.md](#).

License

The Kaggle CLI is released under the [Apache 2.0 license](#).
